## NEW AMIDINO DERIVATIVES AND THEIR USE AS THROMBIN INHIBITORS

### Field of the Invention

5

This invention relates to novel pharmaceutically useful compounds, in particular competitive inhibitors of trypsin-like serine proteases, especially thrombin, their use as medicaments, pharmaceutical compositions containing them and synthetic routes to their production.

10

### Background

Blood coagulation is the key process involved in both haemostasis (i.e. the prevention of blood loss from a damaged vessel) and thrombosis (i.e. the formation of a blood clot in a blood vessel, sometimes leading to vessel obstruction).

Coagulation is the result of a complex series of enzymatic reactions. One of the ultimate steps in this series of reactions is the conversion of the proenzyme prothrombin to the active enzyme thrombin.

Thrombin is known to play a central role in coagulation. It activates platelets, leading to platelet aggregation, converts fibrinogen into fibrin monomers, which polymerise spontaneously into fibrin polymers, and activates factor XIII, which in turn crosslinks the polymers to form insoluble fibrin. Furthermore, thrombin activates factor V and factor VIII leading to a "positive feedback" generation of thrombin from prothrombin.

By inhibiting the aggregation of platelets and the formation and crosslinking of fibrin, effective inhibitors of thrombin would therefore be expected to

exhibit antithrombotic activity. In addition, antithrombotic activity would be expected to be enhanced by effective inhibition of the positive feedback mechanism.

## 5 Prior Art

The early development of low molecular weight inhibitors of thrombin has been described by Claesson in *Blood Coagul. Fibrinol.* (1994) 5, 411.

- 10 Blombäck *et al* (in *J. Clin. Lab. Invest.* 24, suppl. 107, 59, (1969)) reported thrombin inhibitors based on the amino acid sequence situated around the cleavage site for the fibrinogen A $\alpha$  chain. Of the amino acid sequences discussed, these authors suggested the tripeptide sequence Phe-Val-Arg (P9-P2-P1, hereinafter referred to as the P3-P2-P1 sequence) would be the most  
15 effective inhibitor.

Thrombin inhibitors based on dipeptidyl derivatives with an  $\alpha,\omega$ -aminoalkyl guanidine in the P1-position are known from US Patent N° 4,346,078 and International Patent Application WO 93/11152. Similar, structurally related,  
20 dipeptidyl derivatives have also been reported. For example International Patent Application WO 94/29336 discloses compounds with, for example, aminomethyl benzamidines, cyclic aminoalkyl amidines and cyclic aminoalkyl guanidines in the P1-position; European Patent Application 0 648 780, discloses compounds with, for example, cyclic aminoalkyl guanidines  
25 in the P1-position.

Thrombin inhibitors based on peptidyl derivatives, also having cyclic aminoalkyl guanidines (e.g. either 3- or 4- aminomethyl-1-amidinopiperidine) in the P1-position are known from European Patent  
30 Applications 0 468 231, 0 559 046 and 0 641 779.

Thrombin inhibitors based on tripeptidyl derivatives with arginine aldehyde in the P1-position were first disclosed in European Patent Application 0 185 390.

5 More recently, arginine aldehyde-based peptidyl derivatives, modified in the P3-position, have been reported. For example, International Patent Application WO 93/18060 discloses hydroxy acids, European Patent Application 0 526 877 des-amino acids, and European Patent Application 0 542 525 O-methyl mandelic acids in the P3-position.

10

Inhibitors of serine proteases (e.g. thrombin) based on electrophilic ketones in the P1-position are also known. For example, European Patent Application 0 195 212 discloses peptidyl  $\alpha$ -keto esters and amides, European Patent Application 0 362 002 fluoroalkylamide ketones, European Patent  
15 Application 0 364 344  $\alpha,\beta,\delta$ -triketocompounds, and European Patent Application 0 530 167  $\alpha$ -alkoxy ketone derivatives of arginine in the P1-position.

Other, structurally different, inhibitors of trypsin-like serine proteases based  
20 on C-terminal boronic acid derivatives of arginine and isothiuronium analogues thereof are known from European Patent Application 0 293 881.

More recently, thrombin inhibitors based on peptidyl derivatives have been disclosed in European Patent Application 0 669 317 and International Patent  
25 Applications WO 95/35309, WO 95/23609 and WO 94/29336.

Moreover, achiral thrombin inhibitors based on aminopyridine and aminopyridazine derivatives have recently been disclosed in International Patent Applications WO 94/20467, WO 96/06832 and WO 96/06849. Other  
30 achiral thrombin inhibitors have more recently been disclosed in Bioorg.

Med. Chem. Lett. 7, 1283 (1997).

However, there remains a need for effective inhibitors of trypsin-like serine proteases, such as thrombin. There is a particular need for compounds which are both orally bioavailable and selective in inhibiting thrombin over other serine proteases. Compounds which exhibit competitive inhibitory activity towards thrombin would be expected to be especially useful as anticoagulants and therefore in the therapeutic treatment of thrombosis and related disorders.

- 5 The compounds of the invention may be isolated from their reaction mixtures using conventional techniques.

It will be appreciated by those skilled in the art that in the process described above the functional groups of intermediate compounds may need to be  
10 protected by protecting groups.

Functional groups which it is desirable to protect include hydroxy, amino, amidino, guanidino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl and diarylalkylsilyl groups (e.g. *t*-  
15 butyldimethylsilyl, *t*-butyldiphenylsilyl or trimethylsilyl) and tetrahydropyranyl. Suitable protecting groups for hydroxy groups, which groups are attached to adjacent carbon atoms include O,O'-isopropylidene. Suitable protecting groups for amino, amidino and guanidino include *t*-butyloxycarbonyl or benzyloxycarbonyl. Amidino and guanidino nitrogens  
20 may be either mono- or diprotected. Suitable protecting groups for carboxylic acid include C<sub>1-6</sub> alkyl or benzyl esters.

The protection and deprotection of functional groups may take place before or after a reaction step.

25

Protecting groups may be removed in accordance with techniques which are well known to those skilled in the art and as described hereinafter.

The use of protecting groups is fully described in "Protective Groups in  
30 Organic Chemistry", edited by J W F McOmie, Plenum Press (1973), and

"Protective Groups in Organic Synthesis", 2nd edition, T W Greene & P G M Wutz, Wiley-Interscience (1991).

It will also be appreciated by those skilled in the art that, "protected  
5 derivatives" of compounds of formula I may be formed prior to a final  
deprotection step. Although they may not possess pharmacological activity  
as such, certain "protected derivatives" of compounds of formula I may be  
administered parenterally or orally and thereafter metabolised in the body to  
form compounds of the invention which are pharmacologically active. Such  
10 derivatives may therefore be described as "prodrugs". All prodrugs of  
compounds of formula I are included within the scope of the invention.

#### **Medical and pharmaceutical use**

15 The compounds of the invention are useful because they possess  
pharmacological activity. They are therefore indicated as pharmaceuticals.

According to a further aspect of the invention there is thus provided the  
compounds of the invention for use as pharmaceuticals.

20

In particular, the compounds of the invention are potent inhibitors of  
thrombin for example as demonstrated in the tests described below.

The compounds of the invention are thus expected to be useful in those  
25 conditions where inhibition of thrombin is required.

The compounds of the invention are thus indicated in the treatment or  
prophylaxis of thrombosis and hypercoagulability in blood and tissues of  
animals including man.

30

It is known that hypercoagulability may lead to thrombo-embolic diseases. Conditions associated with hypercoagulability and thrombo-embolic diseases which may be mentioned include activated protein C resistance, such as the factor V-mutation (factor V Leiden), and inherited or acquired deficiencies  
5 in antithrombin III, protein C, protein S, heparin cofactor II. Other conditions known to be associated with hypercoagulability and thrombo-embolic disease include circulating antiphospholipid antibodies (Lupus anticoagulant), homocysteinemi, heparin induced thrombocytopenia and defects in fibrinolysis. The compounds of the invention are thus indicated  
10 both in the therapeutic and/or prophylactic treatment of these conditions.

The compounds of the invention are further indicated in the treatment of conditions where there is an undesirable excess of thrombin without signs of hypercoagulability, for example in neurodegenerative diseases such as  
15 Alzheimer's disease.

Particular disease states which may be mentioned include the therapeutic and/or prophylactic treatment of venous thrombosis and pulmonary embolism, arterial thrombosis (eg in myocardial infarction, unstable angina,  
20 thrombosis-based stroke and peripheral arterial thrombosis) and systemic embolism usually from the atrium during arterial fibrillation or from the left ventricle after transmural myocardial infarction.

Moreover, the compounds of the invention are expected to have utility in  
25 prophylaxis of re-occlusion (ie thrombosis) after thrombolysis, percutaneous trans-luminal angioplasty (PTA) and coronary bypass operations; the prevention of re-thrombosis after microsurgery and vascular surgery in general.

30 Further indications include the therapeutic and/or prophylactic treatment of

disseminated intravascular coagulation caused by bacteria, multiple trauma, intoxication or any other mechanism; anticoagulant treatment when blood is in contact with foreign surfaces in the body such as vascular grafts, vascular stents, vascular catheters, mechanical and biological prosthetic valves or any  
5 other medical device; and anticoagulant treatment when blood is in contact with medical devices outside the body such as during cardiovascular surgery using a heart-lung machine or in haemodialysis.

In addition to its effects on the coagulation process, thrombin is known to  
10 activate a large number of cells (such as neutrophils, fibroblasts, endothelial cells and smooth muscle cells). Therefore, the compounds of the invention may also be useful for the therapeutic and/or prophylactic treatment of idiopathic and adult respiratory distress syndrome, pulmonary fibrosis following treatment with radiation or chemotherapy, septic shock,  
15 septicemia, inflammatory responses, which include, but are not limited to, edema, acute or chronic atherosclerosis such as coronary arterial disease, cerebral arterial disease, peripheral arterial disease, reperfusion damage, and restenosis after percutaneous trans-luminal angioplasty (PTA).

20 Compounds of the invention that inhibit trypsin and/or thrombin may also be useful in the treatment of pancreatitis.

According to a further aspect of the present invention, there is provided a method of treatment of a condition where inhibition of thrombin is required  
25 which method comprises administration of a therapeutically effective amount of a compound of the invention, or a pharmaceutically acceptable salt thereof, to a person suffering from, or susceptible to such a condition.

The compounds of the invention will normally be administered orally,  
30 intravenously, subcutaneously, buccally, rectally, dermally, nasally,

tracheally, bronchially, by any other parenteral route or *via* inhalation, in the form of pharmaceutical preparations comprising active compound either as a free base, or a pharmaceutical acceptable non-toxic organic or inorganic acid addition salt, in a pharmaceutically acceptable dosage form. Depending  
5 upon the disorder and patient to be treated and the route of administration, the compositions may be administered at varying doses.

The compounds of the invention may also be combined and/or co-administered with any antithrombotic agent with a different mechanism of  
10 action, such as the antiplatelet agents acetylsalicylic acid, ticlopidine, clopidogrel, thromboxane receptor and/or synthetase inhibitors, fibrinogen receptor antagonists, prostacyclin mimetics and phosphodiesterase inhibitors and ADP-receptor ( $P_2T$ ) antagonists.

15 The compounds of the invention may further be combined and/or co-administered with thrombolytics such as tissue plasminogen activator (natural, recombinant or modified), streptokinase, urokinase, prourokinase, anisoylated plasminogen-streptokinase activator complex (APSAC), animal salivary gland plasminogen activators, and the like, in the treatment of  
20 thrombotic diseases, in particular myocardial infarction.

According to a further aspect of the invention there is thus provided a pharmaceutical formulation including a compound of the invention, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier.

25

Suitable daily doses of the compounds of the invention in therapeutical treatment of humans are about 0.001-100 mg/kg body weight at peroral administration and 0.001-50 mg/kg body weight at parenteral administration.

30 The compounds of the invention have the advantage that they may be more

efficacious, be less toxic, be longer acting, have a broader range of activity, be more potent, produce fewer side effects, be more easily absorbed than, or that they may have other useful pharmacological properties over, compounds known in the prior art.

## Biological Tests

### Test A

#### Determination of Thrombin clotting Time (TT)

10 Human thrombin (T 6769, Sigma Chem. Co) in buffer solution, pH 7.4, 100  $\mu$ l, and inhibitor solution, 100  $\mu$ l, were incubated for one minute. Pooled normal citrated human plasma, 100  $\mu$ l, was then added and the clotting time measured in an automatic device (KC 10, Amelung).

15 The clotting time in seconds was plotted against the inhibitor concentration, and the  $IC_{50}TT$  was determined by interpolation.

$IC_{50}TT$  is the concentration of inhibitor in the test that doubles the thrombin clotting time for human plasma.

20

### Test B

#### Determination of thrombin inhibition with a chromogenic, robotic assay.

The thrombin inhibitor potency was measured with a chromogenic substrate method, in a Plato 3300 robotic microplate processor (Rosys AG, CH-8634  
25 Hombrechtikon, Switzerland), using 96-well, half volume microtitre plates (Costar, Cambridge, MA, USA; Cat No 3690). Stock solutions of test substance in DMSO (72  $\mu$ L), 1 mmol/L, were diluted serially 1:3 (24 + 48  $\mu$ L) with DMSO to obtain ten different concentrations, which were analysed as samples in the assay. 2  $\mu$ L of test sample was diluted with 124  $\mu$ L assay  
30 buffer, 12  $\mu$ L of chromogenic substrate solution (S-2366, Chromogenix,

Mölndal, Sweden) in assay buffer and finally 12  $\mu$ L of  $\alpha$ -thrombin solution, (Human  $\alpha$ -thrombin, Sigma Chemical Co.) both in assay buffer, were added, and the samples mixed. The final assay concentrations were: test substance 0.00068 - 13.3  $\mu$ mol/L, S-2366 0.30 mmol/L,  $\alpha$ -thrombin 0.020 NIHU/mL.

5 The linear absorbance increment during 40 minutes incubation at 37°C, was used for calculation of percentage inhibition for the test samples, as compared to blanks without inhibitor. The  $IC_{50}$ -robotic value, corresponding to the inhibitor concentration which caused 50% inhibition of the thrombin activity, was calculated from a log dose vs. % inhibition curve.

10

### Test C

#### Determination of the inhibition constant $K_i$ for human thrombin

$K_i$ -determinations were made using a chromogenic substrate method, performed at 37°C on a Cobas Bio centrifugal analyser (Roche, Basel, Switzerland). Residual enzyme activity after incubation of human

15  $\alpha$ -thrombin with various concentrations of test compound was determined at three different substrate concentrations, and was measured as the change in optical absorbance at 405 nm.

20 Test compound solutions (100  $\mu$ L; normally in buffer or saline containing BSA 10 g/L) were mixed with 200  $\mu$ L of human  $\alpha$ -thrombin (Sigma Chemical Co) in assay buffer (0.05 mol/L Tris-HCl pH 7.4, ionic strength 0.15 adjusted with NaCl) containing BSA (10 g/L), and analysed as samples in the Cobas Bio. A 60  $\mu$ L sample, together with 20  $\mu$ L of water, was

25 added to 320  $\mu$ L of the substrate S-2238 (Chromogenix AB, Mölndal, Sweden) in assay buffer, and the absorbance change ( $\Delta A/\text{min}$ ) was monitored. The final concentrations of S-2238 were 16, 24 and 50  $\mu$ mol/L and of thrombin 0.125 NIH U/ml.

30 The steady state reaction rate was used to construct Dixon plots, *i.e.*

diagrams of inhibitor concentration vs.  $1/(\Delta A/\text{min})$ . For reversible, competitive inhibitors, the data points for the different substrate concentrations typically form straight lines which intercept at  $x = -K_i$ .

#### 5 Test D

##### Determination of Activated Partial Thromboplastin Time (APTT)

APTT was determined in pooled normal human citrated plasma with the reagent PTT Automated 5 manufactured by Stago. The inhibitors were added to the plasma (10  $\mu\text{L}$  inhibitor solution to 90  $\mu\text{L}$  plasma) followed by the  
10 reagent and calcium chloride solution and APTT was determined in the mixture by use of the coagulation analyser KC10 (Amelung) according to the instructions of the reagent producer. The clotting time in seconds was plotted against the inhibitor concentration in plasma and the  $\text{IC}_{50}\text{APTT}$  was determined by interpolation.

15

$\text{IC}_{50}\text{APTT}$  is defined as the concentration of inhibitor in human plasma that doubled the Activated Partial Thromboplastin Time.

#### Test E

##### 20 Determination of thrombin time *ex vivo*

The inhibition of thrombin after oral or parenteral administration of the compounds of the invention were examined in conscious rats which, one or two days prior to the experiment, were equipped with a catheter for blood sampling from the carotid artery. On the experimental day blood samples  
25 were withdrawn at fixed times after the administration of the compound into plastic tubes containing 1 part sodium citrate solution (0.13 mol per L) and 9 parts of blood. The tubes were centrifuged to obtain platelet poor plasma. The plasma was used for determination of thrombin time as described above.

30 The citrated rat plasma, 100  $\mu\text{L}$ , was diluted with a saline solution, 0.9%,

100  $\mu$ L, and plasma coagulation was started by the addition of human thrombin (T 6769, Sigma Chem Co, USA) in a buffer solution, pH 7.4, 100  $\mu$ L. The clotting time was measured in an automatic device (KC 10, Amelung, Germany).

5

The invention is illustrated by way of the following examples.
